SIGNHIFY STUDIO - FOR PIYUSH RAJ SINGH - 4 NOVEMBER 2026

Build one flagship. Prove it in public. Let it sell the next job.

Roadmap and implementation plan: three portfolio projects with complete PRD and TRD for the flagship, a verified audit of GitHub, Vercel, JobAutopilot and LinkedIn, and a full GTM autopilot for Instagram, YouTube and Signhify.

Flagship: Signhify GTM Autopilot OS | Project 2: JobAutopilot Pro | Project 3: RAG Support Copilot

The honest version first: no project guarantees a job, virality, YouTube monetisation or passive income. What a finished, live, documented flagship does is remove the hiring manager's doubt. That is what this plan builds - in eight weeks, on a free stack, reusing code you already own.

START HERE

Do the flagship first. Everything else feeds it.

You do not need more projects. You already have 13+ listed portfolio builds, 21 public GitHub repositories and a Vercel team full of deployments. You need one system that a stranger can open, understand in 60 seconds, and trust - then two supporting projects that prove depth in job search and RAG.

> **The decision:** Merge Autogram, autoGTM and Autoshorts into one public product - **Signhify GTM Autopilot OS**. It becomes the flagship, the content engine for Signhify, and the demo you link in every application. JobAutopilot Pro and RAG Support Copilot follow, in that order.

Weeks	Build	Public proof at the end
1	Fix and freeze: unblock autogtm-web, pin Autogram, archive dead repos	Clean GitHub, all linked demos READY
2-4	Flagship GTM Autopilot OS v1	Live demo, 3-min video, PRD/TRD in repo
5	Launch week: content autopilot on the flagship itself	7 carousels, 5 reels, 1 long video
6	JobAutopilot Pro: productionise the live ledger	Live product you use daily
7	RAG Support Copilot with eval dashboard	Embeddable widget + eval report
8	Packaging: portfolio, LinkedIn, resume, outreach	One link, one story, everywhere

How to use this document

- **Pages 3-6:** the verified audit and the fix list - do these before writing new code.
- **Pages 7-11:** flagship PRD and TRD - build directly from them.
- **Pages 12-14:** Projects 2 and 3, condensed PRD + TRD, plus the free stack.
- **Pages 15-18:** the GTM autopilot I run for you, with approval gates.
- **Pages 19-20:** job packaging and the week-by-week checklist.

VERIFIED AUDIT - 4 NOV 2026

GitHub: strong engine room, messy shop window

Audit source: GitHub connector for the signed-in account **Warriorlegacy** (hireable: true, account created 25 Apr 2022, 2 followers). Search returned **31 repositories in total including private ones; 21 are public**. That distinction matters - a recruiter only sees the 21.

5

Repos worth pinning
Signhify_CLI, CRM, dxfvec, Autogram and Signhify_Studio - exactly the five your profile README already selects. Keep that set. It is your best page on the internet right now.

9

Autogram workflows
Autogram is described in its README and repo as a Python pipeline with nine scheduled GitHub Actions workflows: fetch, score, architect, fact-check, quality gate, render, stage, publish. This is senior-level material - buried under an early-build neighbourhood.

What is working

- **Profile README is excellent.** It leads with agent runtimes, backend systems and production TypeScript and Python, claims tests and CI, and states that every claim maps to a file, a test or a workflow. Keep that voice everywhere.
- **Descriptions exist on the serious repos.** CRM states Express / Prisma / Postgres with a tested domain layer and Docker. dxfvec states 100% free vectorisation with no API keys. Signhify_CLI states permission-gated tool execution and 5-stage CI.
- **Recent real activity.** Autogram updated 3 Nov 2026, signhify-showcase updated 3 Nov 2026, website-agency updated 3 Nov 2026. You are active - the profile just does not sequence it.

What is hurting you

- **Fragmentation:** signhify-ai, Signhify_Studio, Signhify, signhify-e55771f4 and signhify-showcase read as five starts, not one product. Archive or rename the dead ends.
- **Early-build labels:** Autoshorts says "experiments (early build)" and TuitionTrack says "early scaffold". Recruiters stop there. Either finish the README story or archive.
- **JMD-Online-Book shows 82 open issues.** That reads as neglect, not popularity. Triage, close stale bot issues, or explain them.
- **Private flagships:** autogtm and signhify-autopilot are private, so the two most commercial stories are invisible. The flagship merge fixes this by shipping one public repo.
- **No social proof yet:** most repos show 0 stars. That changes with launch content, not with more repos.

Vercel is live, autoGTM is blocked, LinkedIn needs alignment

Audit source: Vercel connector, team **"Piyush's projects" (piyushs-projects-1495f171)**. The first page alone lists **20 projects**, including web, autogtm-web, api, signhify, examastra, piyush-portfolio, whatsapp-crm-frontend and backend, autogram-ai, adgenesis-ai, tenderbot-global and website_agency.

Project checked	Live state found	What it means
web - JobAutopilot	Latest deployments READY, production	Healthy. This is a shippable product, not a demo.
autogram-ai	3 deployments READY, but the newest is old relative to the repo's 3 Nov activity	Dashboard is stale versus the pipeline. Redeploy or point people to the repo.
autogtm-web	Latest deployments BLOCKED (repeated)	Your most commercial front end is not deploying. Fix this first in Week 1 - check deployment protection, build logs and env vars in that order.

JobAutopilot - https://web-two-gamma-49.vercel.app

Fetched live on 4 Nov 2026. It presents as "JobAutopilot - a reviewable job-search ledger": it syncs **9 public feeds** (Remotive, RemoteOK, Arbeitnow, Hacker News Who is Hiring, Jobicy, Working Nomads, Himalayas, The Muse and We Work Remotely), merges duplicates, shows an explainable fit brief, and keeps one application per requisition with a follow-up draft. Its honesty is a feature: no auto-apply, no LinkedIn scraping, no AI guesses on visa, salary or work authorisation, and a labelled deterministic baseline when no AI provider is configured.

> **Its one flaw is presentation:** the live page still shows sample names (Northwind Labs, Meridian, Fieldnote, Ledgerline), nine visual archetypes and a "Loading..." state. For a portfolio link, ship one default style, real feed data on first paint, and your name on it. Project 2 in this plan does exactly that.

LinkedIn - audited signed-in, with one conflict flagged

Your LinkedIn is https://www.linkedin.com/in/piyushraj-singh . A public fetch is blocked by LinkedIn, but a signed-in audit recorded on 4 Nov 2026 read the real profile. Headline findings: location shown as Varanasi, no Open to Work badge, Experience showing only Signhify, and an Education entry that conflicts with your supplied profile. You confirmed on 4 Nov 2026 that the Delhi record is correct and the LinkedIn entry is wrong - Page 19 carries the full findings and the fix list.

FIX LIST

Week 1: ten fixes, no new features

#	Fix	Done when
1	Unblock autogtm-web deployments	Two consecutive production deployments READY
2	Redeploy autogram-ai from current main	Dashboard shows the latest pipeline run
3	Archive Autoshorts, screenshot-perfect dupes and dead Signhify variants; keep code, remove clutter	Public repo list fits on one screen of serious work
4	Triage JMD-Online-Book's 82 open issues	Open issues are real, labelled tasks only
5	Make the flagship repo public from day one (new repo, clean history)	Public repo with README, LICENSE, CI badge
6	One naming system: Signhify [Product] - no random project names on Vercel	web renamed to jobautopilot; autogtm-web to signhify-gtm
7	Every pinned repo gets: live URL, 30-second GIF or screenshot, Limitations section	A recruiter never lands on code with no picture
8	Secrets sweep: rotate anything ever committed, move to env vars, add gitleaks to CI	Clean scan in CI. Never print a secret in a commit, PDF or chat.
9	Add uptime and failure alerts to GitHub Actions (your Autogram, Autoshorts and autogtm runs have failed repeatedly with no root cause found)	A failure creates an issue automatically
10	Point portfolio, LinkedIn and resume at one flagship URL	Same first link in all three places

> **Rule for the whole plan:** a project is not "done" when it runs on your machine. It is done when a stranger can open the live URL, read the README, watch a 3-minute walkthrough, and run it from the Quick Start without asking you anything.

What I will automate for you in this phase

- Daily health check on the flagship repos and Vercel deployments, reporting only on failure or recovery - this pattern already runs for your automations.
- A weekly audit digest: new stars, forks, issues, deployment state and content performance, in one short message.
- Draft fixes as pull-request descriptions and README rewrites for your approval - I do not push, publish or send without your go-ahead on the specific item.

PROJECT SELECTION

Three projects, ranked by job signal per week of work

Selection tests, applied in order: Does it reuse code you already have? Does it demo in 60 seconds? Does it prove a skill that appears in $5,000+/month AI roles - agents, RAG, evaluation, APIs, deployment? Can a stranger pay for a version of it without you begging?

Rank	Project	Reuses	Job signal	Income path (not a promise)
1	**Signhify GTM Autopilot OS**	Autogram + autoGTM + Autoshorts	Agents, pipelines, official APIs, eval gates, SaaS UX	Template sale, paid setup for agencies, later subscription
2	**JobAutopilot Pro**	Live JobAutopilot (web)	Data ingestion, dedupe, ranking, product polish	One-time Pro template, career-tool micro-SaaS later
3	**RAG Support Copilot**	Enterprise RAG Knowledge Agent	RAG, pgvector, evals, cost and latency instrumentation	Per-shop setup fee, white-label for Signhify clients

What I deliberately did not pick

- **Another chatbot wrapper.** It proves nothing in 2026 and competes with free tools.
- **A trading bot or crypto tool.** High risk, no hiring signal for the roles you are applying to, and income claims would be dishonest.
- **A new 3D WebGL project.** Your Signhify 3D Engine already proves that skill. Depth now beats breadth.
- **DXFVec as a new build.** It is already your best-tested repo (158-test suite per your profile README). In Week 8, wrap it as a free web tool with a paid batch tier only if time remains - do not rebuild it.

> **On "passive income without much effort":** the realistic version is *low-maintenance* income - a template or tool that sells while you sleep, after weeks of building and launching. Anyone promising effort-free income is selling you something. This plan aims for products with near-zero running cost and no daily manual work once live.

FLAGSHIP - PRD

Signhify GTM Autopilot OS: product requirements

One-line promise: Give it a product URL. It builds the audience engine - ICP, content calendar, carousels, reel scripts, scheduled posts via official APIs, and a lead ledger - with a human approval gate before anything publishes.

Problem and users

Indie founders and small agencies know they should post daily and follow up leads. They do neither, because production takes hours and tools cost more than the return. Primary user: a solo founder or 2-10 person agency owner. Secondary user: you - Signhify runs its own GTM on it, which is the case study. Tertiary user: the hiring manager evaluating the repo.

Goals and non-goals

- **Goals:** first content pack approved within 15 minutes of signup; zero publishing without approval in v1; every generated claim traceable to a source; running cost $0 at demo scale.
- **Non-goals (v1):** no auto-apply or auto-DM, no scraping of LinkedIn or Instagram, no engagement bots, no multi-tenant billing, no mobile app.

User stories

1. As a founder, I paste my product URL and get an ICP, three audience pains and a 14-day calendar I can edit.
2. As a founder, I approve a carousel and it renders at 1080 x 1350 and schedules through the official Meta API.
3. As a founder, I get a reel script, captions and a rendered vertical video draft from the same topic - no second tool.
4. As an agency, I see every lead, reply and follow-up draft in one ledger, and nothing sends until I approve it.
5. As a technical evaluator, I open the repo and find the architecture diagram, ADRs, tests and a Limitations section.

Features, in MoSCoW order

Priority	Feature	Acceptance test
Must	Product intake: URL fetch, positioning summary, ICP generator	Summary cites only facts found on the fetched page; unknowns are labelled unknown
Must	Topic engine: scoring for utility, novelty and anti-repetition (from Autogram)	Same topic is not regenerated within the memory window
Must	Carousel studio: 7-10 slide narrative JSON, fact-check and quality gate (score 0-100, banned-cliche list)	Pack below the quality threshold cannot be approved
Must	Renderer: deterministic HTML/CSS to 1080 x 1350 JPEG via Playwright; reel draft 1080 x 1920	Same JSON renders byte-stable layout on re-run
Must	Approval queue and scheduler via official APIs only	No publish call exists without an approval record
Must	Lead ledger: source, status, follow-up draft, history	Every send is logged with approver and timestamp
Should	YouTube pack: long-form outline, script, chapters, thumbnail brief from one approved topic	One topic produces a full video pack in one run
Should	Analytics loop: pull post insights, feed topic scoring	Weekly digest generated automatically
Could	Template export: sell the whole system as a Gumroad template	Export excludes all secrets and personal data
Won't (v1)	Auto-publishing with no gate, paid ads, CRM email blast	Absent from codebase and README roadmap

Success metrics - measured, not vibes

- Activation: percent of new workspaces that approve a first pack within 24 hours.
- Quality: average quality-gate score and percent of packs edited before approval.
- Reliability: scheduled posts published on time; pipeline failure rate per week.
- For your job hunt: flagship link clicks from applications, repo stars, and interview mentions - tracked in your CRM sheet.

Monetisation, honestly sequenced

Phase 1: free public demo and waitlist. Phase 2: one-time template and a paid done-for-you setup for agencies - this is services income, and it is where Signhify already wins work. Phase 3, only after real users ask: a subscription. Payment, tax and contract steps are yours to complete; I prepare the pages and copy, you approve and submit.

FLAGSHIP - TRD

Technical requirements: architecture that reuses what you built

```
Web (Next.js / Vercel)
  |  workspace, calendar, approval queue, lead ledger
API (Next.js routes or FastAPI on Render free tier)
  |  intake -> topic engine -> generation -> fact-check -> quality gate
Workers (GitHub Actions cron + Vercel Cron)
  |  renderer (Playwright, 1080x1350 / 1080x1920) -> R2 staging
  |  publishers (Meta Graph API, YouTube Data API) - official APIs only
Data (Supabase Postgres + pgvector)
  |  workspaces, topics, packs, approvals, posts, leads, insights
LLM layer (provider abstraction from signhify-ai)
  Groq / Gemini free tiers first, BYOK for users, deterministic fallback
```

Design decisions, with reasons

- **Merge, do not rewrite.** Autogram supplies the pipeline stages and templates; autoGTM supplies ICP and lead logic; Autoshorts supplies vertical video experiments. The new repo orchestrates them behind one API and one UI.
- **Deterministic rendering.** Slides and reels render from structured JSON through HTML/CSS and Playwright / FFmpeg. Same input, same output - testable, cacheable, and cheap.
- **Provider abstraction.** Every LLM call goes through one gateway interface with per-provider rate limits, cost logging and a labelled deterministic baseline when no key is configured - the same honesty pattern JobAutopilot already uses.
- **Approval as data.** Publishing requires an `approvals` row. There is no code path from generation to publish that skips it in v1.

Non-functional requirements

Area	Requirement
Cost	$0 infra at demo scale; every external call logged with provider and token count
Performance	Calendar generation under 60 seconds; carousel render under 30 seconds per pack
Reliability	Idempotent jobs with a run ledger; a failed publish retries once, then creates an alert, never a duplicate post
Observability	Structured logs per pipeline stage; weekly health digest; failure creates a GitHub issue

Data, APIs, jobs, security and tests

Core data model (Supabase Postgres)

`workspaces, users, product_profiles, topics, content_packs, slides, approvals, scheduled_posts, leads, followups, insights, pipeline_runs`. Every generated artefact stores its source packet and prompt version, so a claim can be traced and a bad output can be reproduced.

API surface (v1)

- `POST /api/intake` - fetch a product URL, return positioning and ICP draft.
- `POST /api/topics:score` - score and dedupe topics against memory.
- `POST /api/packs` - generate a pack; `POST /api/packs/:id/approve` - the only route that can schedule.
- `POST /api/publish/run` - worker-only, checks approval, publishes via the official API, writes the result.
- `GET /api/insights/weekly` - digest data for the analytics loop.

Scheduled jobs

Job	Cadence	Runner
Topic discovery and scoring	Daily 06:00 IST	GitHub Actions
Pack generation for approved calendar	Daily 06:30 IST	GitHub Actions
Publishing window	Per approved schedule	Vercel Cron / Actions
Insights pull and weekly digest	Sunday evening	GitHub Actions

Security and platform rules

- Supabase Row Level Security on every table; service keys server-side only; user tokens for Meta and YouTube stored encrypted, never in the repo.
- Meta publishing only for Professional (Business or Creator) accounts, with the scopes your Autogram setup already uses: `instagram_business_basic` and `instagram_business_content_publish`. YouTube uploads through the official YouTube Data API with the channel owner's consent.
- No scraping, no credential automation, no engagement manipulation. Rate limits are respected and surfaced in the UI.

Testing and evaluation

- Unit tests for scoring, dedupe and the quality gate; contract tests for both publishing APIs with recorded fixtures.
- Golden-pack eval: 20 fixed topics with expected fact-check outcomes, run in CI on every prompt change.
- End-to-end dry-run mode (already Autogram's pattern) that renders and stages everything and publishes nothing.

FLAGSHIP - DELIVERY

Build sequence for the flagship: 15 working days

Days	Milestone	Exit test
1-2	New public repo, CI, data model, intake endpoint	URL in, cited ICP draft out
3-5	Port Autogram topic, fact-check and quality-gate stages	Golden-pack eval green in CI
6-8	Carousel renderer and approval queue UI	Approve a pack, see rendered slides
9-10	Meta scheduling in dry-run, then one live approved post	Post appears, run ledger matches
11-12	Reel draft renderer (FFmpeg captions, 1080 x 1920) and YouTube pack	One topic becomes carousel + reel + video outline
13	Lead ledger ported from autoGTM	Lead to follow-up draft, approval logged
14	README, architecture diagram, ADRs, Limitations, 3-min demo video	A stranger runs the Quick Start unaided
15	Launch pack: waitlist page, template export checklist	Demo, repo and portfolio all link to each other

> **Demo script (60 seconds):** Paste signhify.dpdns.org. Show the ICP it extracts. Approve the calendar. Open one carousel. Show the quality gate rejecting a weak slide. Show the approval record. End on the lead ledger. That sequence proves agents, evals, APIs and product sense in one minute.

Risks specific to this build

- **Free-tier LLM limits:** mitigate with caching, small models for scoring, and BYOK for real users.
- **Meta app review and token expiry:** keep dry-run as the default demo mode; a reviewer can evaluate everything without live publishing.
- **Scope creep:** the Won't list in the PRD is the contract. New ideas go to a v2 issue, not into the sprint.

PROJECT 2 - PRD + TRD

JobAutopilot Pro: turn your best live demo into a product

PRD summary. Users: remote job seekers drowning in tabs. Promise: nine public feeds in one ledger, an explainable fit brief, one application per requisition, and follow-up drafts that never send without approval - the exact behaviour your live site already describes. Must-have v1: real feed data on first paint (remove the sample companies), saved profile, fit scoring with reasons, status pipeline, follow-up drafts, export. Should-have: salary and sponsorship filters that label "not stated" instead of guessing. Won't: auto-apply, LinkedIn automation, invented salaries.

Users and value: you first - you are applying daily, so the product gets real usage and real screenshots. Then other seekers as a one-time Pro template.

TRD summary

- **Stack:** keep the existing Next.js app (Vercel project "web", deployments READY). Add Supabase for profiles, applications and follow-ups; feed adapters per source with a shared listing schema and dedupe on source + external ID, as the live page already describes.
- **Jobs:** daily feed sync via Vercel Cron; stale-listing detector that marks closed roles instead of presenting them as live.
- **Scoring:** deterministic baseline always available; LLM fit brief optional and labelled. Store the reasons, not just a score.
- **Tests:** one contract test per feed adapter; dedupe regression tests; a "no invented fields" test that fails if salary or sponsorship appears without a source value.
- **Polish tasks:** pick one visual archetype as default, put your name and portfolio link on the page, replace the generic deployment name "web" and the web-two-gamma URL with a named project and a clean domain or subdomain.

> **Why this helps the job hunt twice:** it is both a portfolio product and the tool that runs your own search. In interviews you can show your own ledger - real applications, real follow-ups, real outcomes.

PROJECT 3 - PRD + TRD

RAG Support Copilot: the project enterprise roles ask about

PRD summary. Users: small e-commerce and SaaS teams answering the same support questions daily. Promise: drop in a chat widget trained only on their docs and site; every answer cites its source; anything uncertain hands off to a human with a transcript. Must-have v1: doc and URL ingestion, cited answers, handoff, an eval dashboard. Won't: answering without a source, training on customer data across tenants, autonomous refunds or account actions.

Features and acceptance tests

Feature	Acceptance test
Ingestion: PDF, docs, sitemap crawl with chunking and embeddings	Re-ingest updates changed pages and removes deleted ones
Retrieval on Supabase pgvector with hybrid keyword fallback	Eval set shows retrieval recall on a fixed question bank
Cited generation with refusal when evidence is weak	Out-of-scope question returns a handoff, not an invention
Eval dashboard: faithfulness checks, latency, cost per answer, top failed questions	Dashboard is the screenshot in the README - it is the differentiator
Embeddable widget: one script tag, tenant-isolated	Two test tenants cannot see each other's data (RLS test)

TRD summary

- **Stack:** Next.js widget and dashboard, FastAPI or Next.js API for ingestion, Supabase Postgres + pgvector, Groq / Gemini free tiers for generation with BYOK for clients, Vercel hosting.
- **Builds on:** your Enterprise RAG Knowledge Agent and your Oracle 23ai / pgvector vector-search experience from your verified stack. State only what the demo actually implements.
- **Income path:** per-shop setup through Signhify, then a white-label version for agency clients. Setup is a service, the widget is the asset that keeps working.

FREE STACK

The $0 stack - and where $0 ends

Layer	Free choice in this plan	Watch-out
Hosting	Vercel (web, APIs, Cron)	Free tiers have usage and cron limits - verify at build time
Database	Supabase Postgres + pgvector	Free projects pause when idle; add a keep-alive health job
LLMs	Groq and Gemini free tiers; BYOK for users	Rate limits are real; cache aggressively, log every call
Scheduling	GitHub Actions cron; Vercel Cron	Actions minutes and delays vary; jobs must be idempotent
Media	Playwright rendering, FFmpeg, Cloudflare R2 staging	Keep renders deterministic and assets compressed
Video voice	Free TTS options evaluated at build time; captions always	Check each tool's licence for commercial use before publishing
Payments (later)	Gumroad for templates - you already have Gumroad connected	Tax, payout and product setup are owner-only steps
Analytics	Vercel Analytics, platform insights APIs	One weekly digest, not dashboard addiction

> **Honest cost note:** "Completely free" holds for building, demoing and the first real users. It does not hold forever - a product with paying users will eventually need a paid tier somewhere. That is a good problem, and the architecture above keeps the first paid step small and obvious.

Income ladder, in order of realism

1. **Job income first.** These projects exist to land a $5,000+/month role. That is the largest, fastest return.
2. **Setup services.** Agencies pay for a working GTM or RAG setup long before they pay for software.
3. **Templates.** The flagship and DXFVec web tool as one-time Gumroad products.
4. **Subscriptions last.** Only with proven demand. Subscriptions are not passive at small scale - support is real work.

GTM AUTOPILOT

How I automate your GTM - production on autopilot, publishing with your gate

Here is the exact operating model I can run for you, using the flagship once built - and, in manual-assist mode, starting now with Autogram.

Stage	What runs automatically	Your part
Research	Daily pull of product updates, repo activity, trending questions in your niche; topics scored and deduped	Nothing
Drafting	Carousel packs, reel scripts, captions, hooks, YouTube outlines - fact-checked, quality-gated	Nothing
Review pack	One daily digest with rendered previews and one-line approve / reject per item	Approve the batch - one message
Publishing	Approved items schedule and publish via official APIs; failures alert and retry once	Nothing, unless a token expires
Learning	Insights pulled weekly; winning hooks and topics feed the scorer; losers are retired	Read the weekly digest

> **The gate is non-negotiable and it protects you:** sends, posts and applications go out only for the specific items you approved. That is the pattern already in place for your outreach and job applications, and it is why an account ban or a bad post is unlikely. Fully hands-off publishing is available as a setting in the flagship for low-risk content types - you choose it per channel, in writing.

One engine, every channel

One approved topic becomes five assets: an Instagram carousel, a motion reel, a LinkedIn post in your peer-level voice, an X thread, and a YouTube video pack. You approve the topic once; the engine derives the formats. That is the whole trick to "posting everywhere" without living on social media.

INSTAGRAM AUTOPILOT

Reels and carousels: the Signhify Instagram engine

The weekly rhythm

Slot	Format	Content pillar
Mon, Wed, Fri	Carousel, 7-10 slides, 1080 x 1350	Teach: one AI system, broken down plainly
Tue, Thu, Sat	Motion reel, 1080 x 1920, captions burned in	Show: a build, a before / after, a 30-second demo
Daily	Stories from the same pack	Poll, progress shot, one link to the live demo
Sunday	Rest / best-of repost	Highest-save post of the week, re-cut

How a reel is made, end to end

1. Topic approved from the daily pack.
2. Script written to a 3-second hook, one idea, one proof shot, one call to action: "Live demo in bio."
3. Motion graphics rendered deterministically: kinetic captions, product screen capture, waveform or code visual - no stock-footage spam, no reused content from others.
4. Rendered at 1080 x 1920 with FFmpeg, staged on a public HTTPS URL, published through the Meta container flow: create container, poll until ready, publish - the flow Autogram already implements.
5. First comment with hashtags posted by the engine; insights pulled after 24 hours and 7 days.

> **What I will not do:** buy followers, run engagement pods, repost other creators' work, or use unofficial automation that risks the account. Growth here comes from volume of genuinely useful, original posts and from every post pointing at a live product. "Viral" is an outcome nobody can schedule - anyone who promises it is guessing.

YOUTUBE AUTOPILOT

Long-form YouTube on autopilot - built to qualify, not to gamble

The monetisation bar, from YouTube's own Help pages

The YouTube Partner Program requires, among other conditions: following the channel monetisation policies, living in an eligible country, no active Community Guidelines strikes, and a linked AdSense for YouTube account - plus either **1,000 subscribers with 4,000 valid public watch hours in the last 12 months**, or **1,000 subscribers with 10 million valid Shorts views in the last 90 days**. Source: YouTube Help, "YouTube Partner Program overview and eligibility" (support.google.com/youtube/answer/72851).

> **Read that bar honestly:** the Shorts route needs 10 million views in 90 days. The realistic route for a technical channel is long-form watch hours. Automation gets you consistency; it does not get you watch time without videos developers actually finish.

The weekly long-form pipeline

1. **Monday:** topic picked from the week's best-performing carousel - the audience has already voted.
2. **Tuesday:** script pack generated: hook, chapters, demo steps, code shown on screen, pinned-comment draft. You record or approve the synthetic-voice version - your choice per video.
3. **Wednesday:** assembly: screen capture of the real product, captions, chapter markers, thumbnail from a tested template (one claim, three words, your product visible).
4. **Thursday:** upload via the official YouTube Data API with title, description with live-demo link, chapters and end screen pointing to the next build video.
5. **Always:** every Short is a cut of the long video, and every long video is linked from Instagram and LinkedIn that week.

Series that fit your proof, not trends

- "I automated X" - one real system per episode: GTM, job search, support RAG.
- "Rebuilding my own tools" - Autogram, autoGTM and JobAutopilot, in public.
- "Free stack SaaS" - the $0 architecture from page 14, one layer per episode.

Two long videos a week for eight weeks is a library of sixteen searchable assets that also serve as interview material. That - not a monetisation date - is the commitment.

SIGNHIFY GROWTH SYSTEM

Signhify Studio: 30-day autopilot calendar

Channel	Cadence	Job it does
Instagram	3 carousels + 3 reels + daily stories / week	Discovery and saves; every post ends at a live demo
YouTube	2 long videos / week + Shorts cut from them	Search, watch hours, interview proof
LinkedIn	3 posts / week, in your voice, no filler phrases	Recruiters and clients - your highest-value audience
X	Threads derived from carousels	Builder community reach
Portfolio + GitHub	Updated at every milestone	Conversion: where every channel points

Content pillars - only four, on rotation

1. **Build in public:** what shipped this week, with the live link.
2. **Teach the system:** one concept from the flagship - agents, evals, RAG - in plain language.
3. **Proof:** a client-style result, a test suite passing, a pipeline run - screenshots, not claims.
4. **Offer:** once a week only - the template, the setup service, or the 15-minute call link from your profile.

Rules that keep it working

- Every post links to something live. No live link, no post.
- Repurpose, do not re-create: one topic, five formats (page 15).
- Measure weekly: saves and shares on Instagram, watch time on YouTube, profile views and demo clicks on LinkedIn. Double the pillar that wins; cut the one that loses, monthly.
- Approvals stay batched: one daily review pack from me, one approval from you.

> **What success looks like at day 30:** not a follower number - a system that has run for 30 days without you thinking about it, a library of 40+ assets, and every asset pointing at the flagship. Audience compounds from there; the system is the achievement you can show an employer today.

JOB PACKAGING

LinkedIn, portfolio and GitHub: one story, three surfaces

LinkedIn - signed-in audit, 4 Nov 2026

A live signed-in audit recorded on 4 Nov 2026 found: location shown as **Varanasi**; headline beginning "AI Systems and Software Engineer | Building Agent Runtimes..."; a banner selling agency websites rather than Generative AI; **no Open to Work badge**; 33 projects and 100 skills listed; **no Recommendations**; Experience showing only Signhify - your Yescom and HCLTech roles are missing; and Education showing Galgotias University BTech CS 2023-2027.

> **Confirmed by you on 4 Nov 2026 - and the fix is smaller than feared:** the correct record is University of Delhi B.Sc. Hons Electronics 2022-2026, plus B.A. General 2022-2025, and your main LinkedIn profile already contains both correct entries. Only the extra Galgotias BTech CS 2023-2027 entry needs deleting - it is also the header education link. A fix attempt on 4 Nov 2026 was blocked because the browser session was signed into a duplicate empty profile, not your main 500+ profile, so no edit was made. Sign in as the main profile's owner and delete that one entry - a two-minute job - before the next application. One naming point remains open: your profile file names the B.A. institution as Vinayaka Missions Sikkim University, while a 2026-11-04 application message used a different name; the profile-file version is used here until you pick one name.

- **Headline (after the flagship ships):** Generative AI Engineer | Founder, Signhify Studio | Agents, RAG and GTM automation - 5x Oracle Certified. Use only titles your confirmed record supports.
- **Banner:** replace the agency-websites banner with the flagship: name, one-line promise, live URL.
- **Open to Work:** turn it on for AI Engineer / Generative AI roles, remote, if you want recruiters to find you this sprint.
- **Experience:** add the missing Yescom and HCLTech entries exactly as in your verified profile; keep dates consistent everywhere.
- **Featured:** flagship live demo first, portfolio second, best build-in-public post third. Remove anything that contradicts the flagship story.
- **Recommendations:** ask two people who have seen your work. An empty section at 100 skills reads as breadth without witnesses.
- **Trim:** 33 projects and 100 skills dilute the signal. Keep the flagship, JobAutopilot, RAG, CRM, CLI and DXFVec prominent.

Portfolio fixes from the same-day live audit

- signhify.dpdns.org is a line-for-line duplicate of signhify.lovable.app - make one the studio site and the other the 3D engine, or redirect one.
- AutoReels still carries the default title "Create Next App" - rename it before anyone important clicks it.
- Signhify CRM's public fetch shows only a loading state and GigMind's status could not be verified - check both logged-in, then decide: fix, label as demo, or unlink.

EXECUTION

Your next eight weeks - and what starts now

When	Action	Owner
Today	Sign in to your main LinkedIn profile and delete the extra Galgotias entry; approve this roadmap	You
Week 1	Ten fixes on page 5; unblock autogtm-web; redeploy Autogram	You build, I audit and draft
Weeks 2-4	Flagship v1 per PRD / TRD, public repo from day one	You build, I review and document
Week 5	Launch: content autopilot runs on the flagship itself	I draft packs, you approve, engine publishes
Week 6	JobAutopilot Pro polish and rename	Shared
Week 7	RAG Support Copilot with eval dashboard	You build, I document
Week 8	Portfolio, LinkedIn, resume and outreach relaunch around one flagship link	I draft, you approve and send

Approval gates that stay in place

- Publishing, sending and submitting: per-batch approval of the exact items.
- Payments, tax forms, contracts and signatures: yours only. I prepare, you complete.
- Credentials: only through a secure card, never in chat.

The one-sentence version

Stop adding projects. Finish the flagship that your existing code is already 60% of, run your own GTM on it in public for 30 days, and walk into every interview with a live system, a content library and a ledger that prove you build like a senior engineer.

> **Start now:** delete the extra Galgotias entry from your main LinkedIn profile, reply "roadmap approved" - and Week 1 begins with the autogtm-web unblock and the Autogram redeploy.

Sources and basis: your verified profile file; GitHub connector audit of Warriorlegacy and Vercel connector audit of team piyushs-projects-1495f171, 4 Nov 2026; live fetch of https://web-two-gamma-49.vercel.app (JobAutopilot); Autogram repository README; LinkedIn and portfolio live audits recorded 4 Nov 2026; YouTube Partner Program eligibility, YouTube Help (support.google.com/youtube/answer/72851). Salary, income, follower and monetisation outcomes are not promised anywhere in this plan.
